

Project: Pokémon Console Game Implementation using C++	
Location:	Seoul National University (2nd Year, Spring Semester)
Duration:	April 2024 – May 2024
Project Overview	
Description:	Developed a two-player, turn-based console game simulating Pokémon battles using C++ . The application manages a roster of characters with distinct abilities and specialties, automating combat mechanics, scoring systems, and final victory conditions .  Figure 1. Game code
Role & Responsibilities:	Core Development: Responsible for the end-to-end implementation of the game, from understanding rule constraints to writing the main execution routine .

	Logic Implementation: Programmed the mechanics for turn-based attacks and defenses, ensuring the system accurately processed player interactions . Quality Assurance: Conducted extensive debugging to verify score calculations and gameplay flow adhered strictly to the defined project parameters .
Key Takeaways & Professional Growth	C++ Programming Proficiency: This project provided rigorous hands-on experience with C++ development . I learned to manage complex inputs, such as parsing text-based data regarding Pokémon attributes and statistics and integrating them effectively into the runtime environment . Algorithmic Problem Solving: A significant challenge involved designing logic to handle dynamic interactions between players . I developed algorithms to execute attacks and defenses based on specific rule sets, which enhanced my ability to break down complex requirements into executable code . This experience refined my approach to state management and logic flow in software design .
